

Manual Testing Assessment

Q1[[Mark 20] You have a shoe-selling e-commerce platform. Now, the client wants to implement a new feature, "Search". During the client meeting, they mentioned they wanted to make the search dynamic, with any keywords or specific text. Now you have a chance to get into more details on the feature. You can ask 10 questions to the client. List the questions according to priority.

Solve:

Priority	Question
1	What exactly should users be able to search for? Should it include just shoe names, or also brands, sizes, colors, categories, or product codes (SKU)?
2	Should the search work with partial keywords? For example, if someone types "Nik", should it show results for "Nike"?
3	Does the search need to be case-insensitive and accent-insensitive? Should "NIKE", "nike", and "Nike" be treated the same?
4	Which product details should be searchable? Should it search through titles, descriptions, tags, brands, etc.?
5	How should search results be sorted? By relevance, price, popularity, or user choice?
6	Do you want real-time suggestions while typing? Or should results appear only after pressing Enter?
7	Should the search handle typos or small spelling mistakes? Like "Adidasz" instead of "Adidas"?
8	Can users filter results after searching? For example, by price range, brand, size, etc.?
9	What happens if no results are found? Should there be suggestions or just a message like "No results found"?
10	Do you want to show users their recent or saved searches? Especially when they are logged in?
